FT NavVision™

Unique Monitoring, Control and Navigation Software

FT NavVision™ is a unique monitoring, control and navigation system that communicates with virtually all shipboard equipment, instruments, engines, tanks and alarm systems.

This unique software displays virtual instruments and alarms, as well as tank levels. The Navigation Module is a stand alone navigation package. The software is completely modular and suitable for all sizes of vessels.

FT NavVision™ is the world's first software that makes it possible to combine electronic navigation with radar, instrument data, engines, tanks, alarms and cameras. Generators, engines, pumps, valves, and lights may be controlled from your computer.

FT NavVision™ Navigation consists of:

- A scanning module to scan charts and additional information.
- A waypoint module for uploading and downloading of waypoints.
- A chart module for worldwide navigation.
- An import module to import charts.
- Instruments to reproduce analogue data.
- Operational screens for configuration and set-up.

Virtual autopilot

In combination with an 'nke' autopilot it is possible to install a virtual autopilot. The "virtual autopilot" is easy to install and operate.

Instruments

More than 400 instruments are available to reproduce practically all possible data on board, such as temperatures, tank levels, engine, and radar and navigation data. Every instrument is individually capable of high and low alarm setting.

Equipment Operation and Control

All shipboard equipment may be operated by our Switch Viewer, a 24 position switch panel, as well; our Layout Viewer allows custom Switch and Control Panels.
